

Feeding the cats at 83 Rhos Hendre

1. There are 2 (two) cats

Chris: male, black, stupid

Katy: female, tabby, very stupid, personality deficiency

2. Food and drink have been provided – there is a plan to help you:

Key: i/e = ingress/egress, fdd = food/drink dispenser, fs = food supply, ws = water supply, b = bins

Figure 1: Schematic of feeding zone (not to scale).

3. Food comes in 2 (two) varieties: dry (more palatable to homo sapien) and damp (more palatable to cats). Sparingly, you might dispense some damp food – this provokes ultra-affection.
4. ‘Feeding’ is a generic term that includes output handling. Output often occurs in the zone marked *Space for shit* on the plan.

Cursory inspection of the shit collector will tell you quickly how they are getting on (sometimes, their accuracy is not all it might be). There are 2 (two) shit collectors: When you detect the collector on the floor to be appreciably better loaded than the one on the shelf, interchange them. You can iterate this procedure ad nauseam¹.

5. **Warm weather only.** If the cats are *Outside* (see Figure 1) and the weather is clement, they may remain there. It is probable that they will need to come *Inside* (see Figure 1) to feed – their understanding of doors is not good and they may need assistance.
6. In emergency, howsoever defined, telephone +44 7720 444055 and ask for Hannah.
7. This task is remunerated with 1 (one) reward: details on application.

¹Advanced feeders might engage with the Cat Shitter supply; this requires an understanding of the bins (*Outside* on the plan).

During times of tempest, the bins may be in the garage, the key to which is on the shelf beside the interface between *Outside* and the *Space for shit*
